Download PostgreSQL

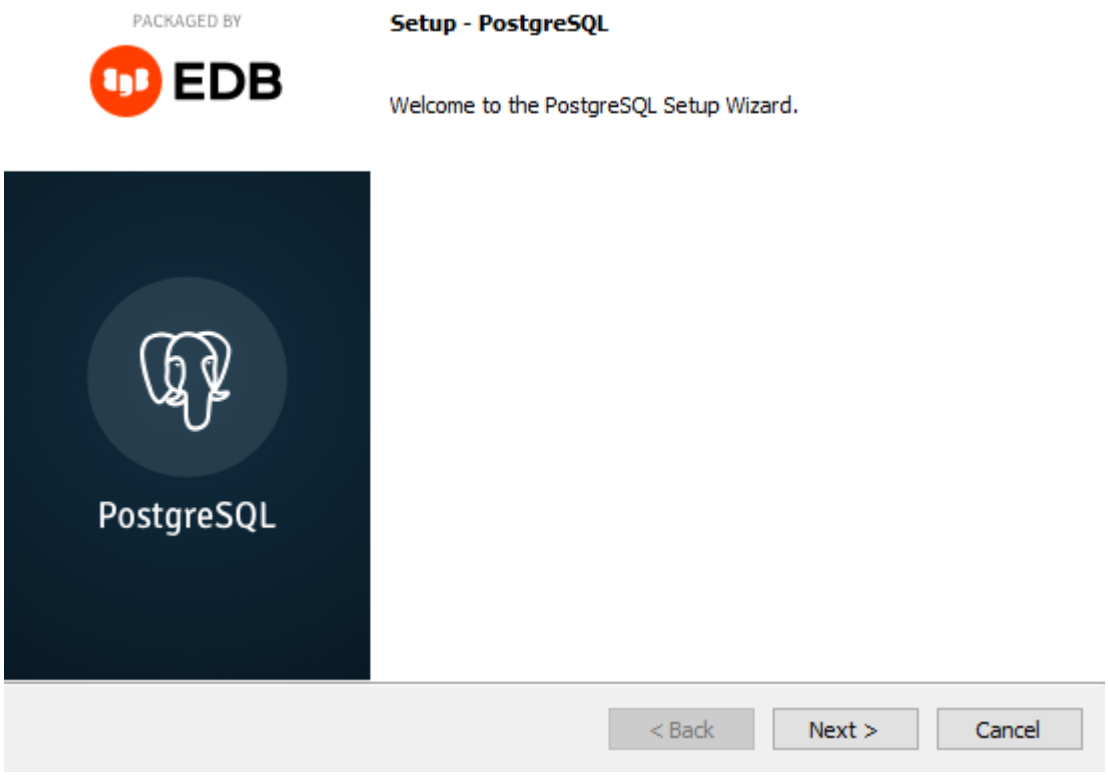

To install PostgreSQL locally on your computer, visit the [installer by EDB](), and download the newest version compatible with your operating system.

I will choose the newest Windows version:

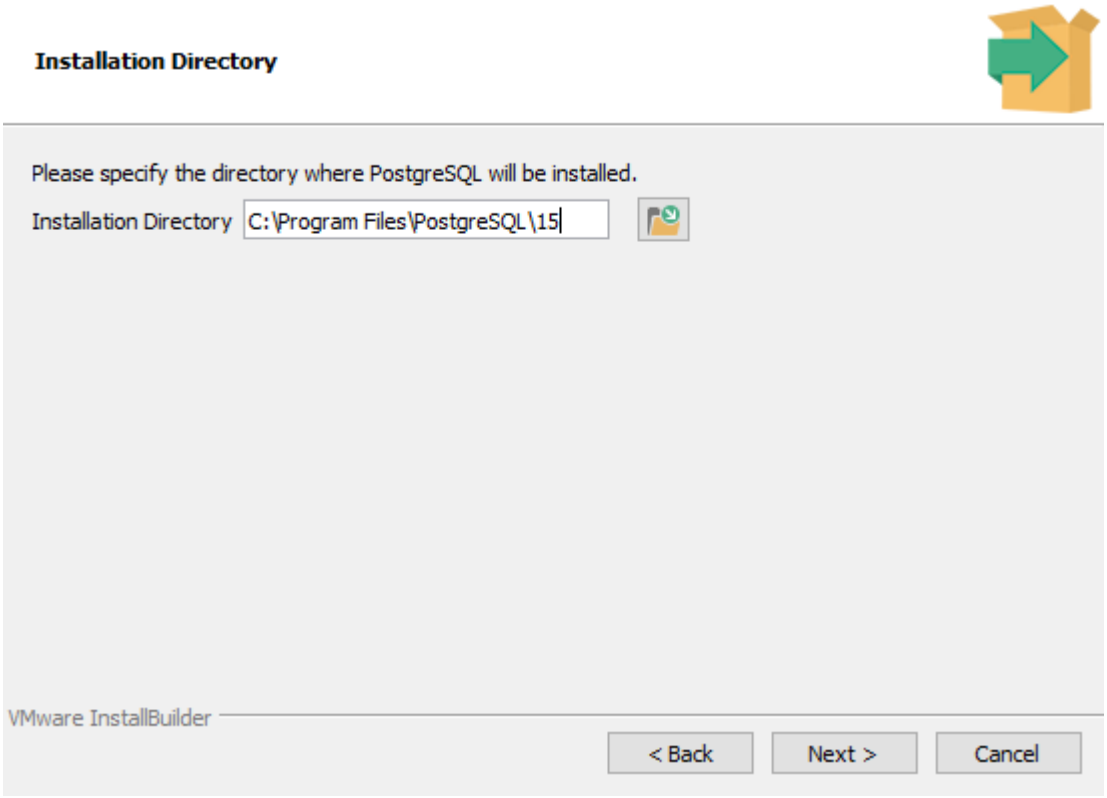

Start the Install

When the downloading is complete, double click the downloaded file and start the installation:

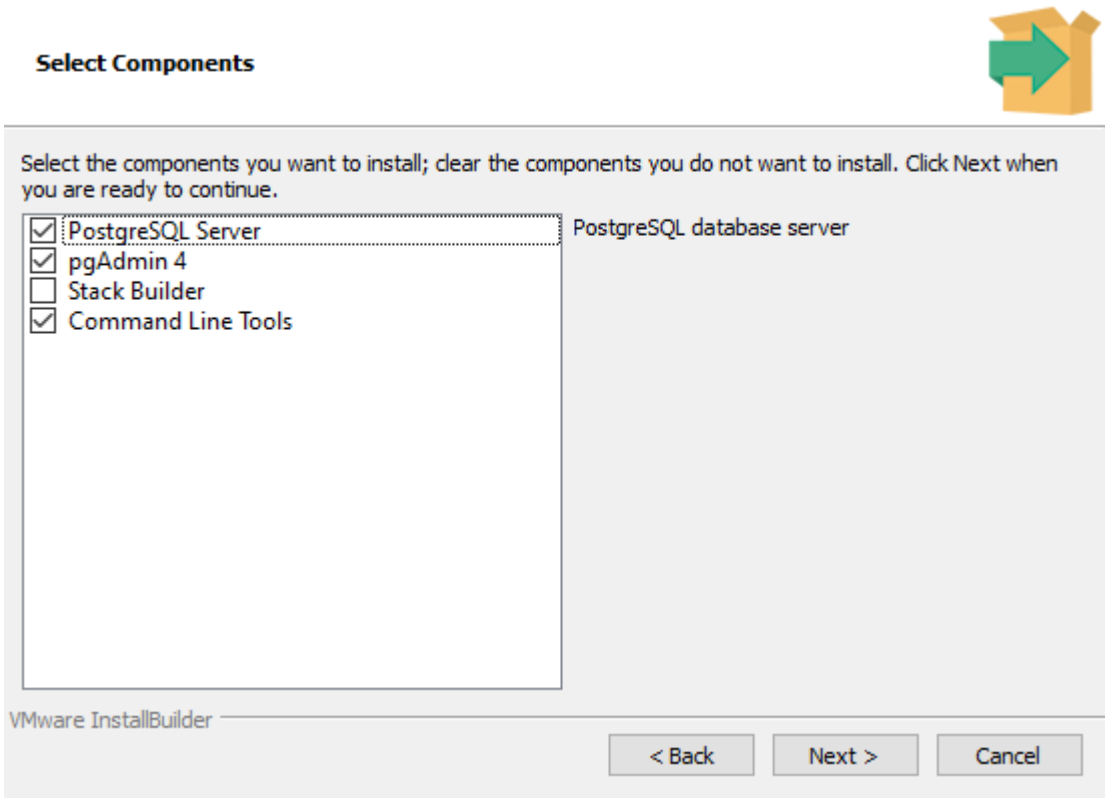

Specify Directory

You can specify the location of PostgreSQL, I will go with the default choice:

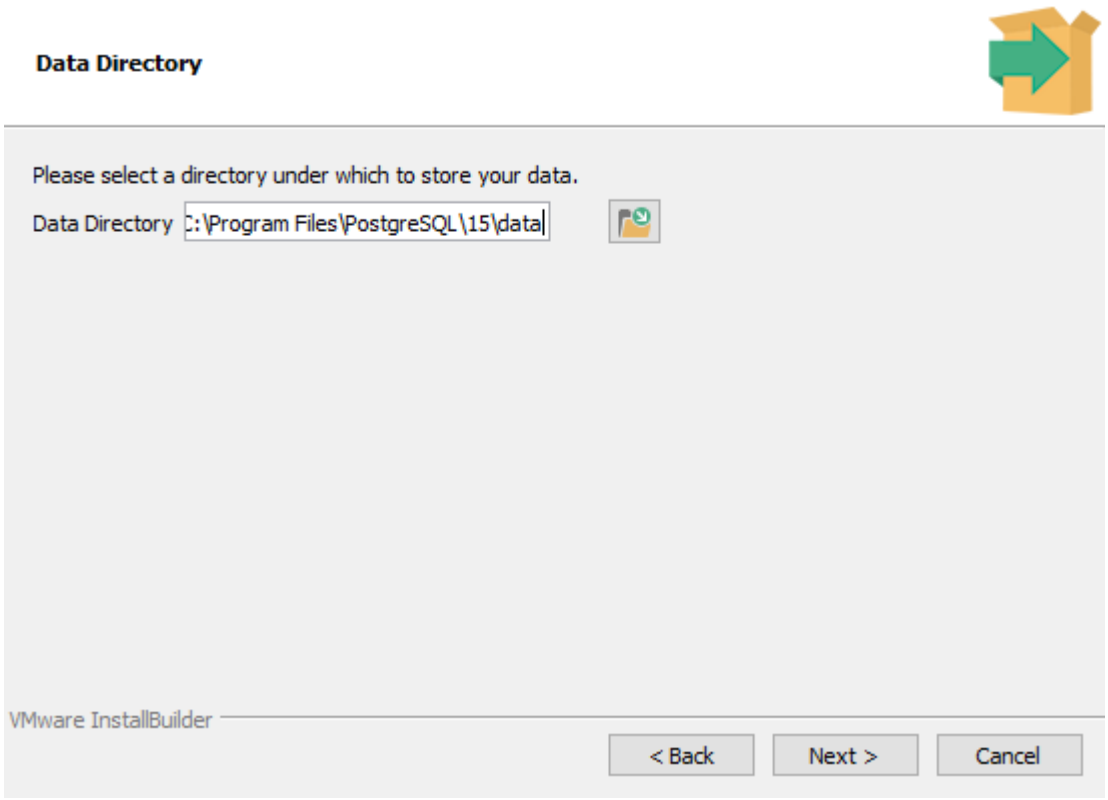

Select Components

To use PostgreSQL, you will need to install the PostgreSQL Server. In this tutorial we will also use the pgAdmin 4 component, and the Command Line Tools:

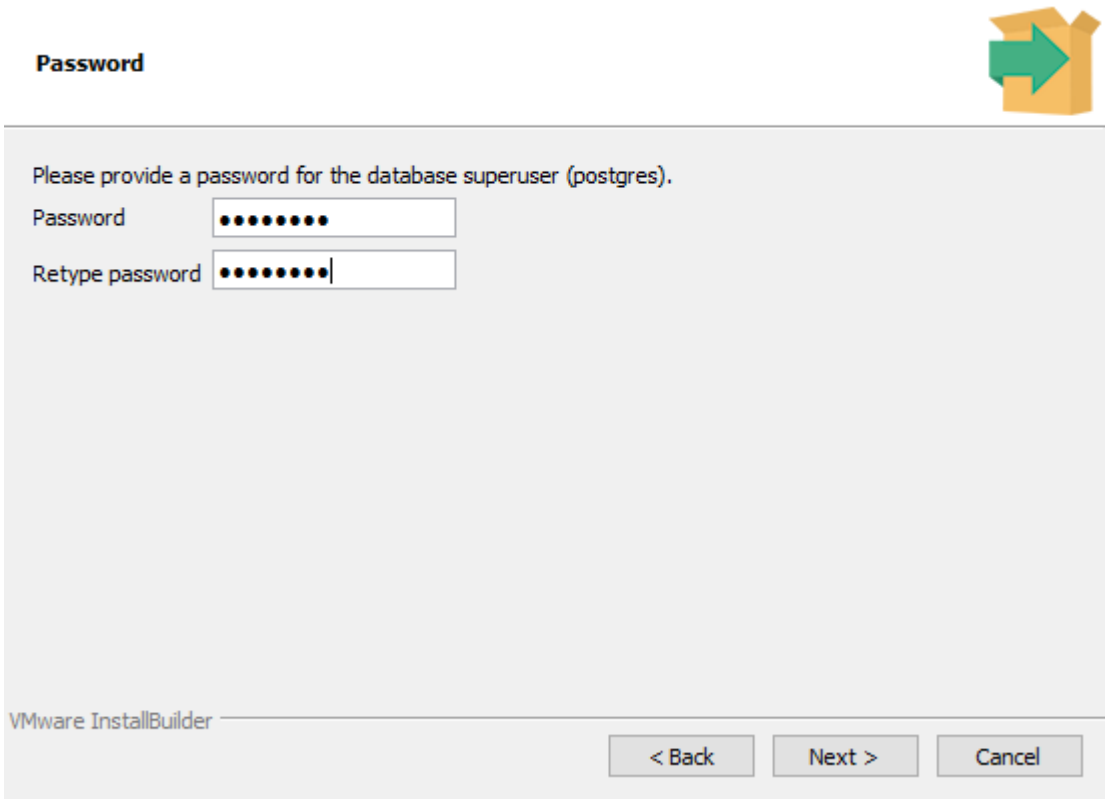

Storage Directory

You can also choose where to store the database data, I will go with the default choice:

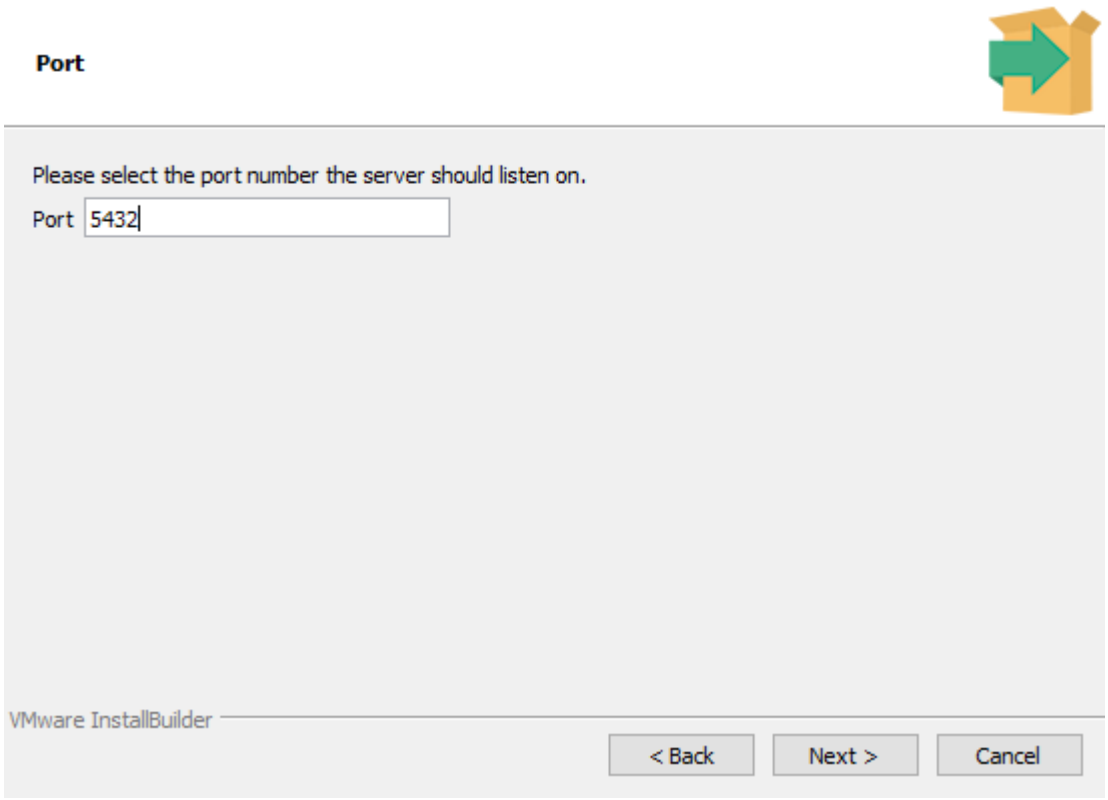

Select Password

You will have to select a password to get access to the database. Since this is a local database, with no incoming connection, I will choose the password 12345678:

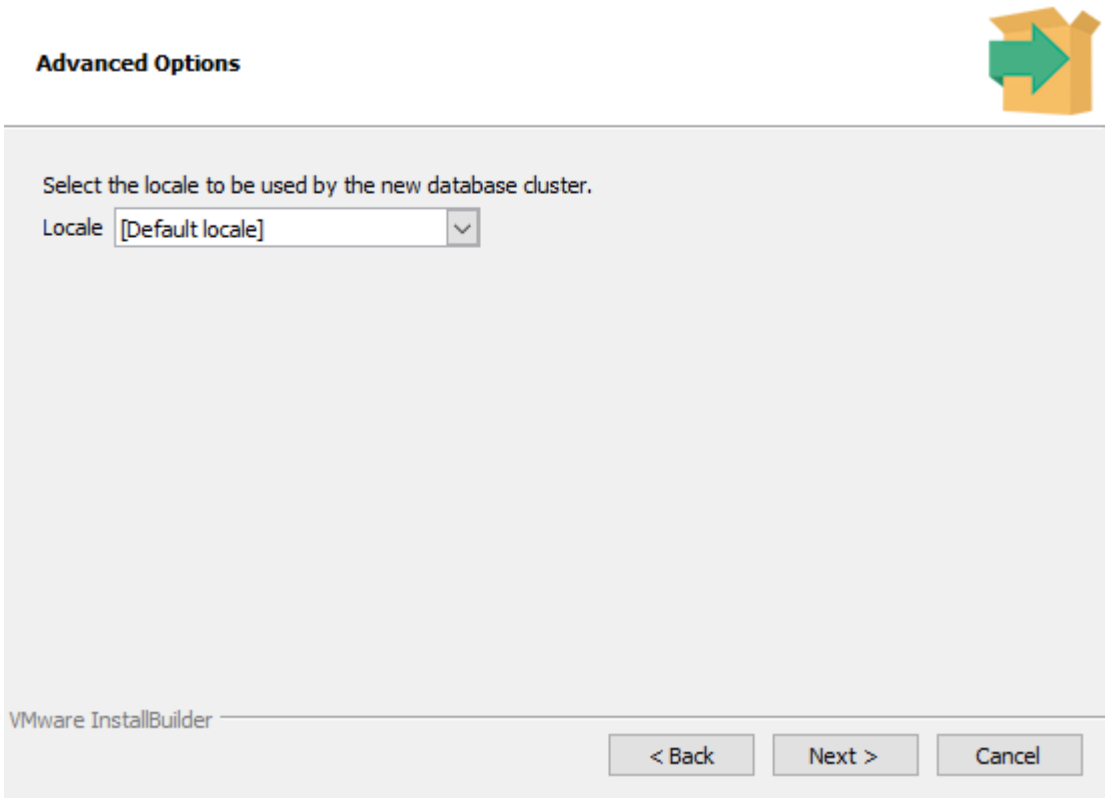

Select Port

You can set the port the server should listen on, I will go with the default choice:

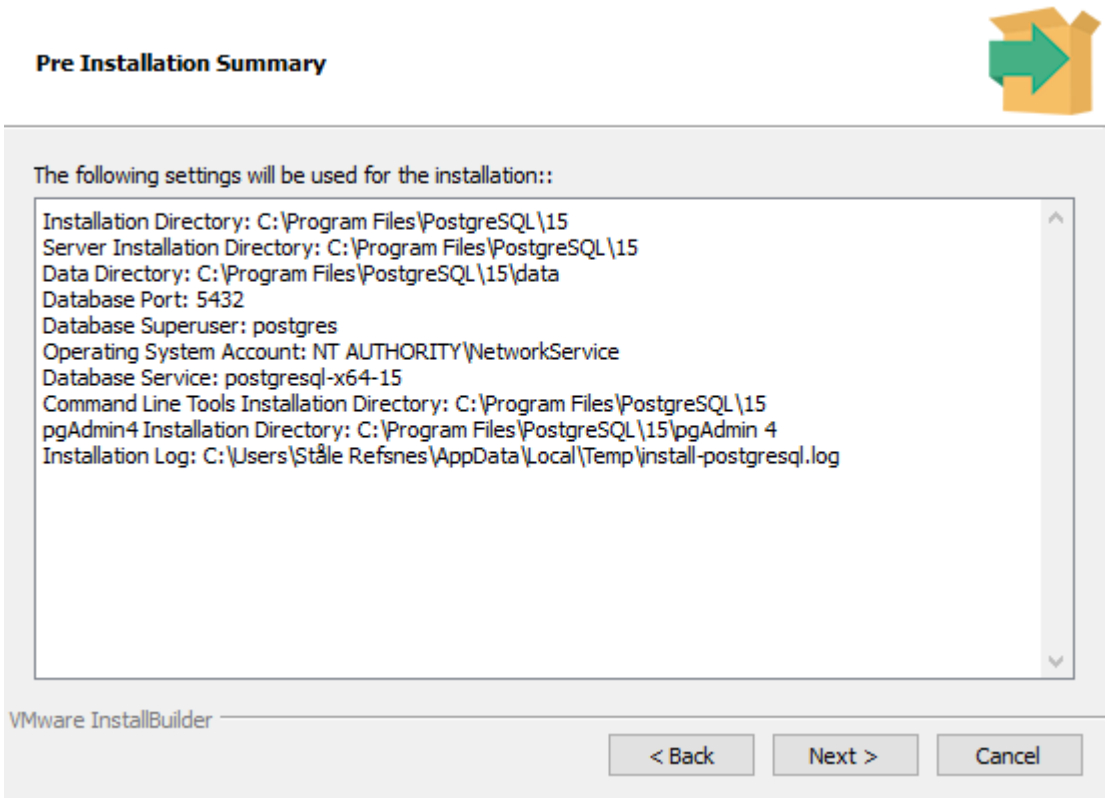

Select Locale

Select the geographically location of the database server:

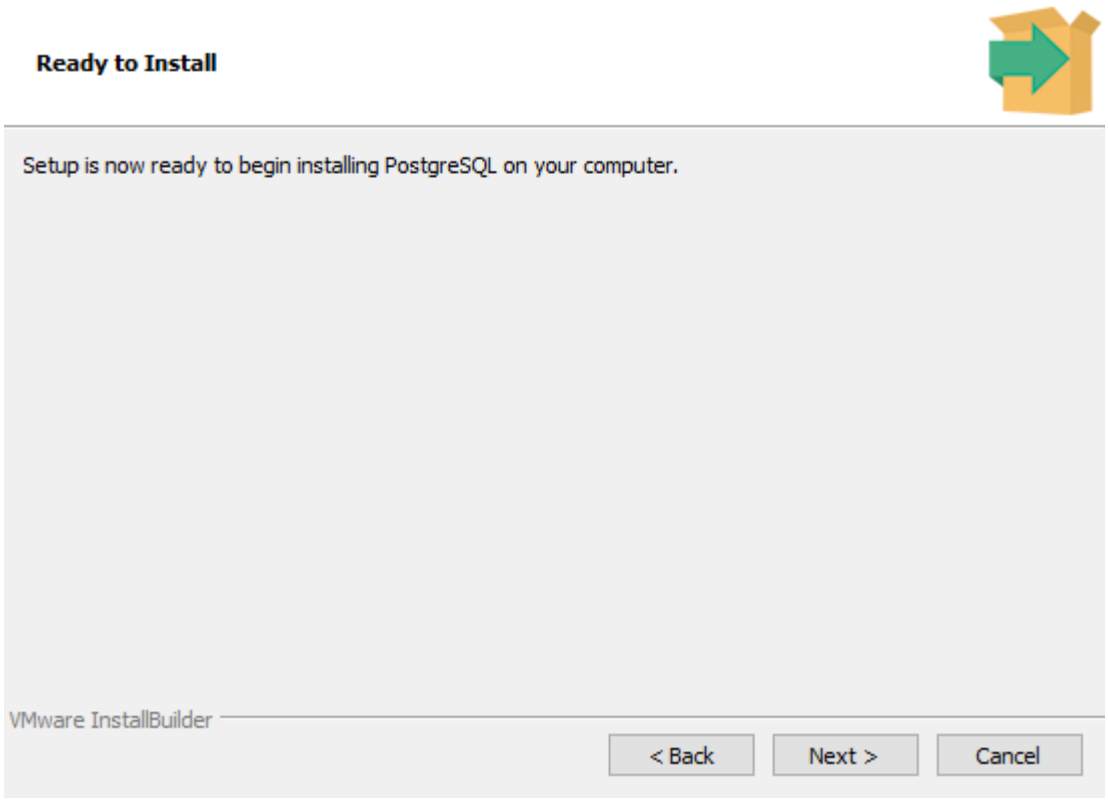

Final Check

If everything looks OK, click 'Next' to continue:

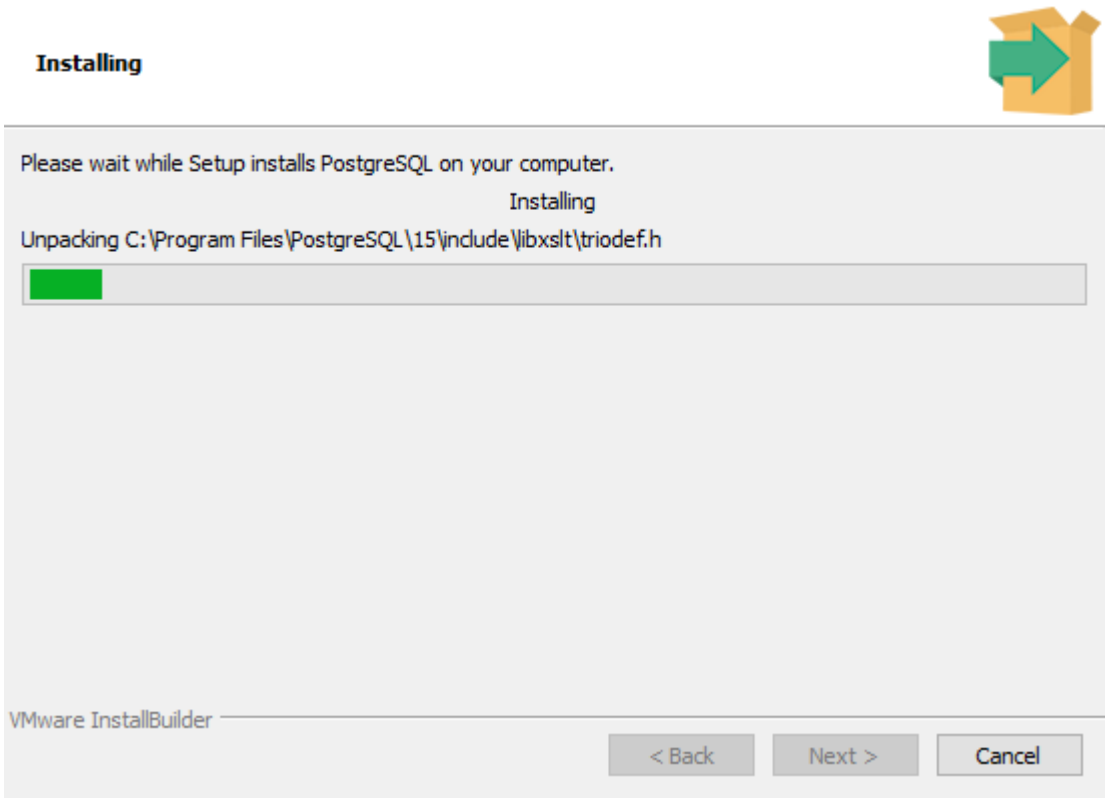

Start Installation:

Click 'Next' to start the installation:

Installing

This can take a while, please wait.

Complete!

Now you have installed PostgreSQL on your computer, and in the next chapter you will start using it!
